Peer review A2 to lab110, from lab105

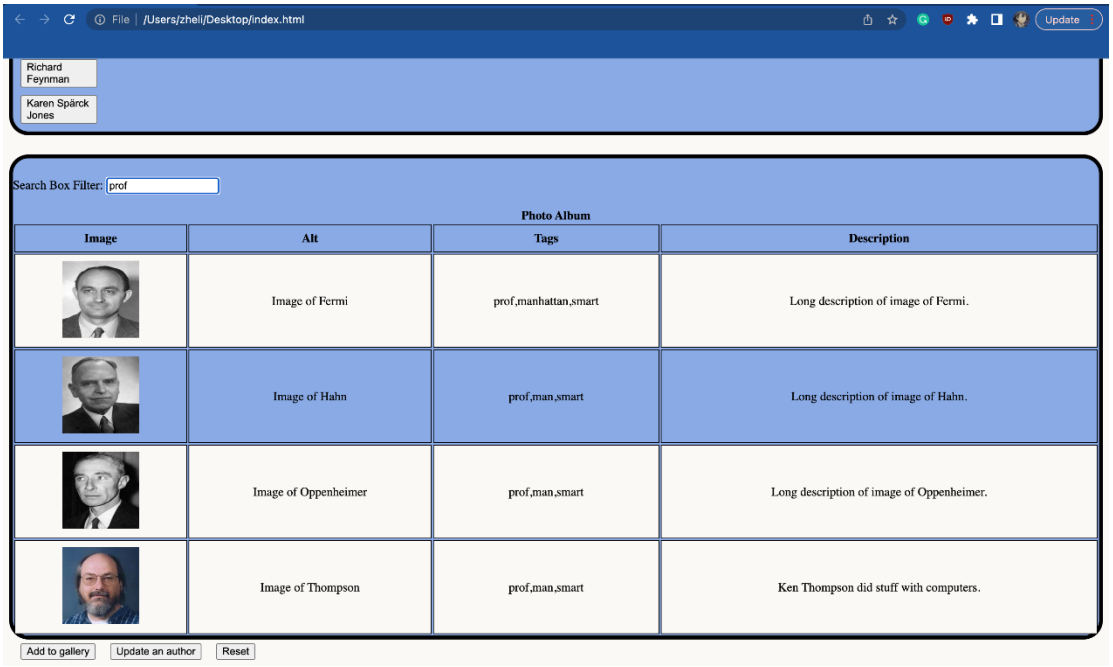

When clicking names, only images of the “clicked” author are showed.

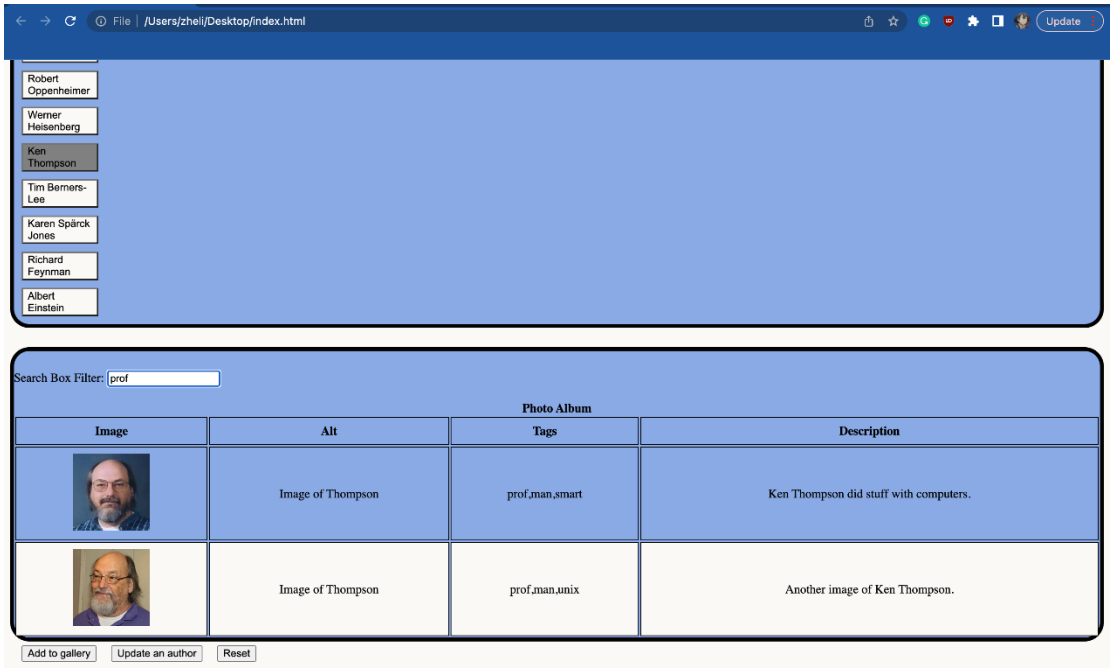

Hence, images filter correctly.

When I “unclick” a name, the webpage goes back to the initial gallery, which means “unclick” works correctly.

The bonus has been implemented. On the one hand, when typing one of the tags, for example, prof, the images of Fermi, Hahn, Oppenheimer, Thompson are showed, hence the bonus works.

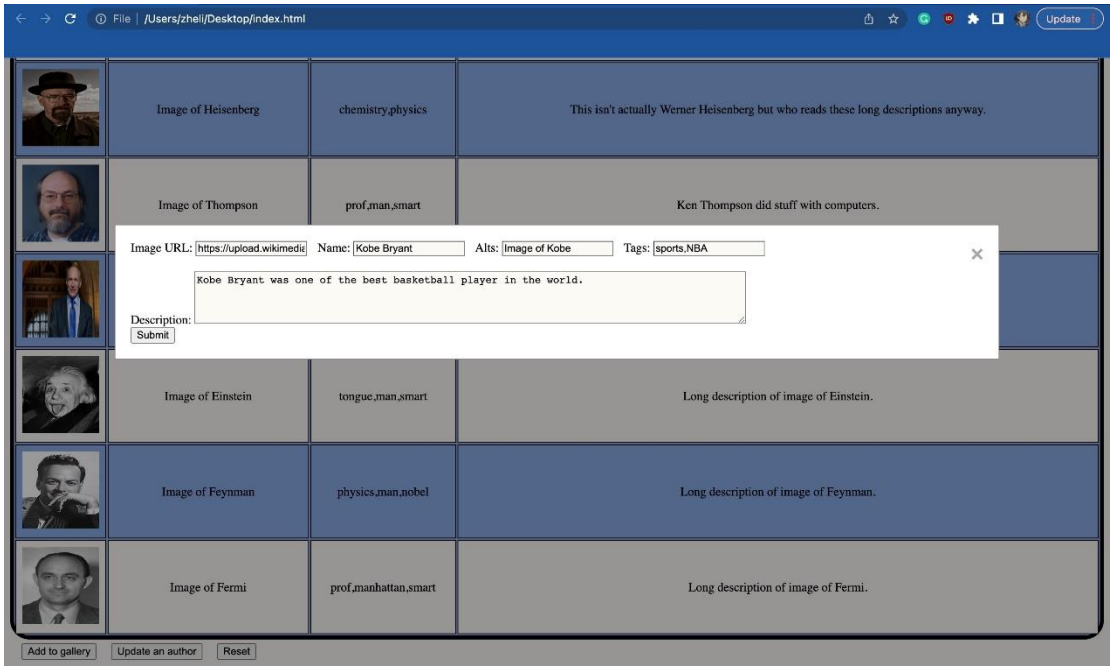

On the other hand, when clicking on the name of the authors, the text field only filter their images, for instance, there are 3 images of Ken Thompson in this gallery, when clicking on the name of Ken Thompson, and typing prof in the text field, only 2 images of this author with prof tag are showed, hence the bonus works.

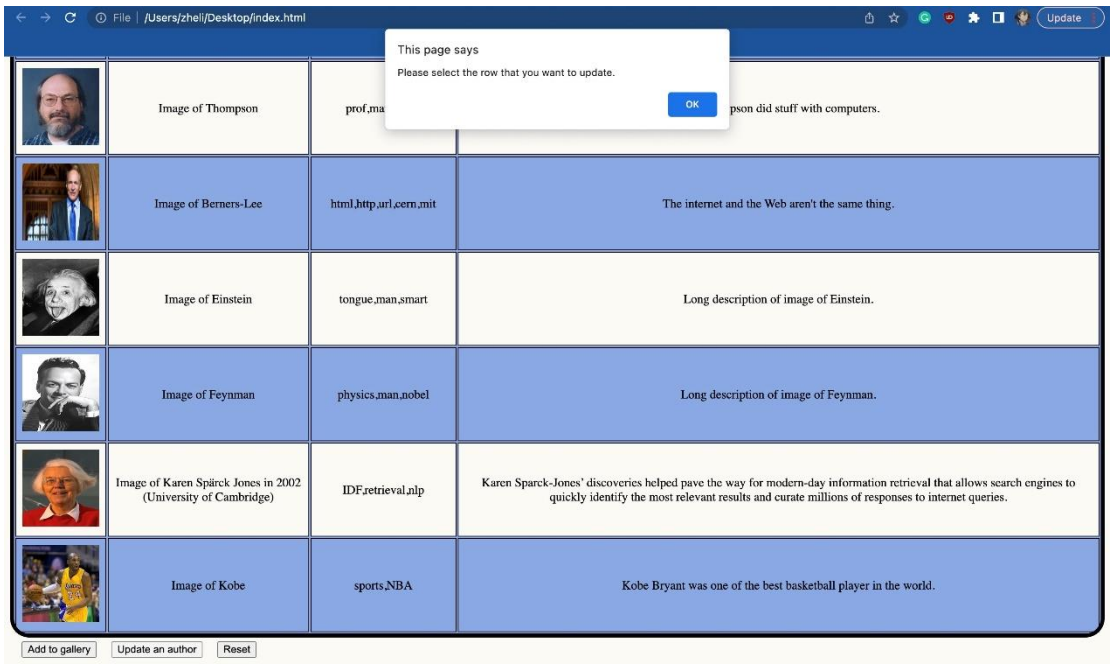

But when I “unclick” the name of Ken Thompson, the page goes back

to the initial gallery, rather than applying the text field search to all the images. This is where they can improve.

For submit modal, clicking add to gallery button to display the submit form modal box. There are 2 buttons on the box, which are submit button and X button. Clicking submit button to submit the information of new author, and clicking X button to close the modal. When clicking anywhere outside of the submit modal, it closes it.

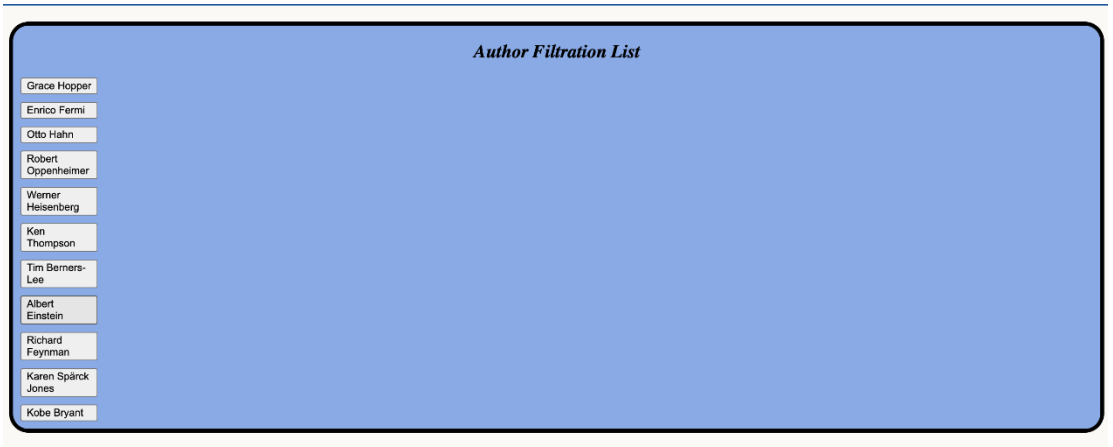

For update model, when clicking update an author button, there is an alert: please select the row that you want to update. Selecting a row to display the update form modal box. There are 2 buttons on the box, which are update button and X button. Clicking update button to update the information of the selected author, and clicking X button or anywhere outside of the update modal to close the modal.

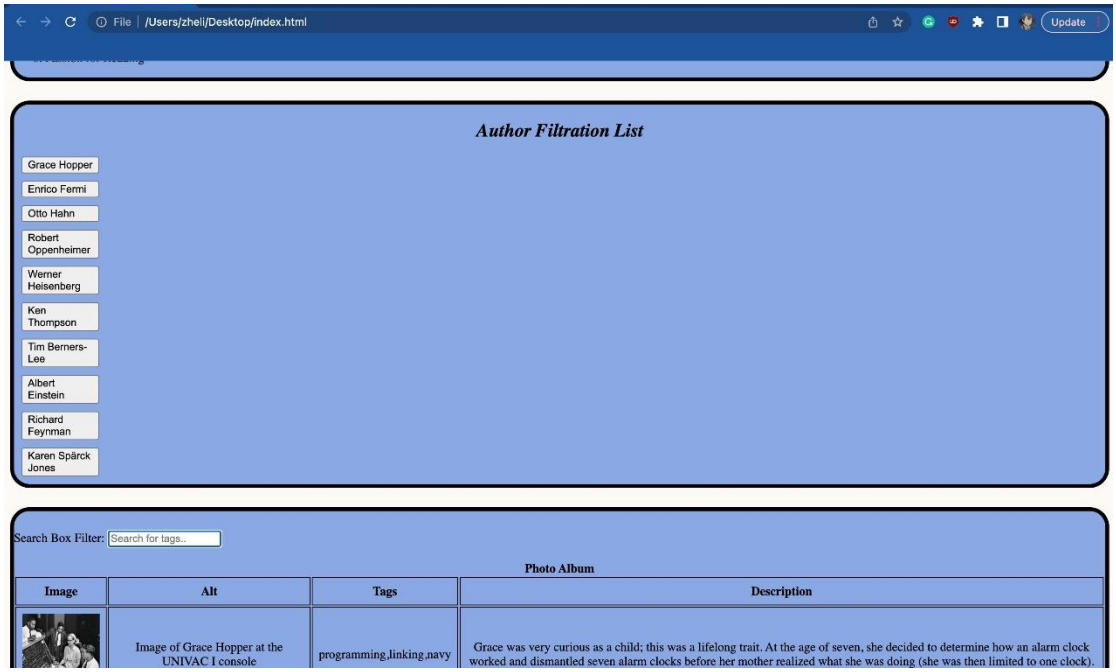

I can update, for example, I updated the image of Einstein with one more physicist tag and new description. And I can reset.

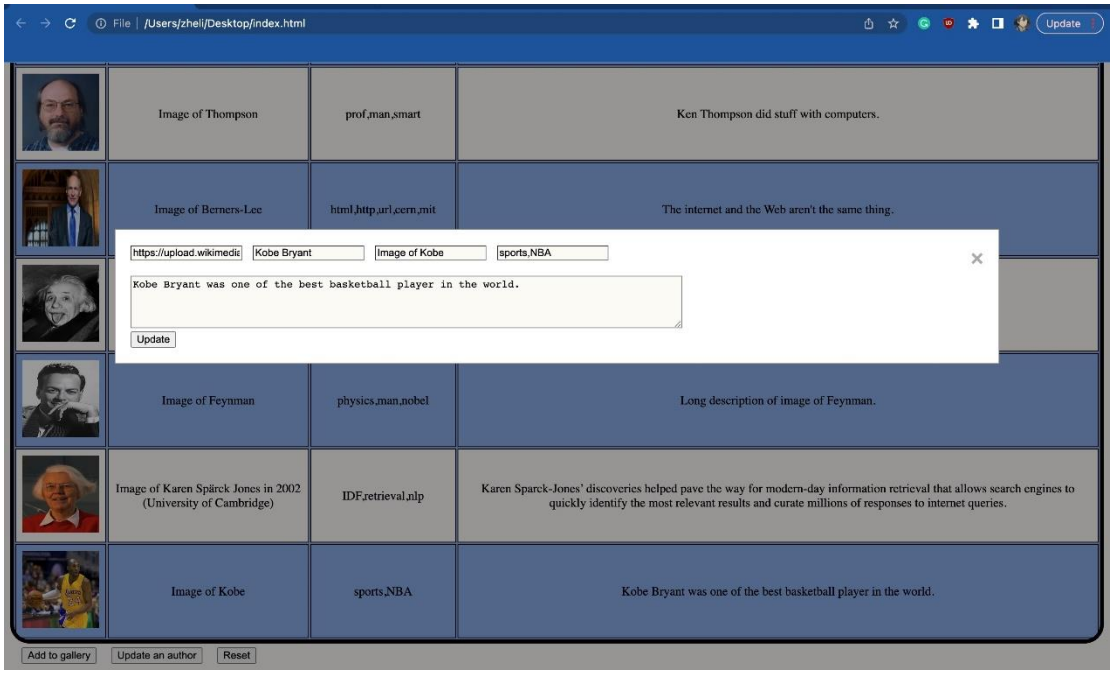

I can also upload new images, for instance, I uploaded image of Kobe.

And the name of Kobe Bryant is in the author filtration list.

The content data is loaded from the server. In the list of author names, the names of all the authors are dynamically inserted, and each name only shows up once. Hence, their gallery content is properly dynamic.

Submitting new images works on a single page, and the new image

shows up without a reload.

Actional feedback:

They have done this assignment well, but there is room for improvement. Firstly, if unclicking an author name, the former text in the search field will not work, unless you type in the text field again. Secondly, the names of authors are on the left side of author filtration list, which is not convenient for users to browse and click. A better way is placing the names of authors on the middle of the author filtration list. Furthermore, they missed the column of author on their photo album table. When viewing photo album, users are only able to see the family names of authors on the Alt column, rather than seeing the full names of authors on the photo album directly. Finally, the photos of authors are too small on the photo album table, which makes some authors hard to be seen clearly, especially the image of Grace Hopper at the UNIVAC.

What we learnt:

We learnt the importance of search field to filter images, which improves users' experience and is more efficient for searching by a tag. Besides, after clicking on author names, the "unclicking" function is a

easier way to take users back to the initial page. In terms of colors, they use alternate colors of white and blue, which makes every row distinctive with its neighboring rows. Moreover, they put specific comments before every function, which improves the readability of their codes.
